gene Genetics Home Reference The KCNH gene belongs to a large family of genes that provide instructions for
making potassium channels These channels, which transport positively charged atoms ions of potassium out of

cells, play key roles in a cell's ability to generate and transmit electrical signals. The specific function of hERG is to transport positively charged potassium ions out of cells, which is essential for the heart's electrical signaling. The hERG gene is located on chromosome 3p21.3 and is a member of the voltage-gated potassium channel superfamily. Mutations in the hERG gene can lead to long QT syndrome, a condition characterized by a prolonged QT interval on an electrocardiogram (ECG), which increases the risk of sudden cardiac death.
